

Utilize Classification Data around the World with Integration Point Global Classification

With the growing complexity of supply chains as well as the increasing number of government regulations around importing and exporting, companies are realizing the need to proactively manage trade compliance data in order to minimize risk. With Integration Point Global Classification companies can easily manage key classification data (product data, HTS numbers, schematics, etc.) required by various countries for importing and exporting products.

Integration Point Global Classification

Regardless of where you are doing business, at some point you will be required to provide classification data on your products. Integration Point Global Classification is the only way to collect, store and access classification data at both a global level using the WCO 6-digit Harmonized Schedule numbers and with multiple country-specific views tailored to the country of interest.

Integration Point Global Classification is a Software-as-a-Service (SaaS) technology that allows companies to quickly eliminate the manual and time-consuming process of classifying products by accessing international trade data via the web. Using Integration Point Global Classification, companies can establish data management standards to help reduce inaccurate classification data, strengthen the exchange of data between trading partners, and provide version control in order to track all changes that take place.

Everything you need to manage global trade data throughout your organization can be captured in a consolidated relational database. Integration Point Global Classification acts as a conduit for information -- you can classify products, store documents such as Material Safety Data Sheets (MSDS), pictures, schematics, Toxic Substance Control Act (TSCA), and indicate import/export program usage related to the various country views.

Benefits of Automation

Integration Point Global Classification enables users to:

- Access global and country-specific classification information via the web
- Set up an approval process to ensure data integrity
- Perform mass updates for easy maintenance of product data such as Harmonized Tariff updates
- Enhance communication to trading partners by providing multi-language capabilities
- Reduce time and resources spent on managing product classifications and related data
- Establish company standards to ensure there are no data management issues
- Eliminate duplicate data entry through interfaces with inventory processing systems, automatically capturing product and transactional information
- Manage key classification data required by various countries
- Link to other government agencies (FDA, FCC, ATF, EPA, etc) to receive product updates
- Store binding ruling information and link out to other systems to take advantage of other rulings, for example the CROSS system in the US
- Set up user-defined fields to track any other company-specific product data
