

## Connect Electronically With US CBP Without The Extra Paperwork

**Connecting and sharing data are two very important attributes of a successful import/export process. In the US, this means all traders must connect with Customs and Border Protection (CBP) and share various pieces of shipment information. Integration Point provides ABI software to connect to and share data directly with CBP without a large investment in hardware.**

### ABI Software

CBP provides the format in which electronic data should be communicated via a document called the CATAIR. The CATAIR is a living document, the format changes often and with little notice to the importer/exporter. To file via the Automated Broker Interface (ABI), a company must use the right format and have a direct connection to CBP - Integration Point is that connection.

Integration Point works as a service center for connecting filers to CBP. Integration Point ABI software takes the necessary data such as advance manifest and product information for the Importer Security Filing (10+2) or imported products and related duty, taxes and fee information on the CBP Form 7501, and melds it into the required format designated by the CATAIR before submitting to CBP. Using a Software-as-a-Service (SaaS) technology, Integration Point ABI software provides filers with an integrated process to quickly connect to CBP without a large investment in hardware and other internal resources. When the CATAIR changes, Integration Point is updated to collect the newly required information and transmit the new format to CBP immediately so that all subscribers have the most up-to-date connection.

Integration Point ABI software includes connectivity to CBP to assist with the following processes:

- Importer Security Filing (ISF or 10+2)
- 3461/7501 Entry Filings and Entry Summary Documentation
- Electronic Bonded Movement using QP/WP and QX/WX
- ePTT for permit to transfer goods to a US Foreign-Trade Zone within port limits
- e214 for US Foreign-Trade Zone Admissions

### Integration Point ABI

A fully automated solution, Integration Point ABI provides filers with a simple to use interface that requires little or no maintenance in a web-based environment. Using the various features of the Integration Point ABI software, filers can be assured they are meeting the reporting requirements of CBP.

- Importer Security Filing or 10+2 - Collects the necessary data from various supply chain sources into a single format and identifies discrepancies before transmitting to CBP
- 3461/7501 Entry Filings - Performs necessary actions to collect data on foreign goods entering the US Commerce and files entry and entry summary, as well as receives CBP statements and allows filers to pay statements using Automated Clearing House (ACH) methods
- Electronic Bonded Movement - Handles all types of In-Bond movements, including QP/WP and QX/WX, while reducing costs and shipment processing time.
- e214 - Processes inbound receipts into an FTZ and files the e214 for all FTZ Admissions as well as the electronic Permit to Transfer

These Integration Point solutions can be implemented as a full ABI package that manages compliance in the US Customs process from beginning to end, or can be used as separate solutions. Integration Point ABI also integrates with other Integration Point solutions such as FTZ Management, Export Management and Import Management. Since all Integration Point solutions are built on the same SaaS platform, you can easily enhance your compliance processes as your company is ready, without a significant IT investment.
