

## Develop a Successful Importer Security Filing Strategy With Integration Point 10+2 Software

**The challenge of the US Customs & Border Patrol (CBP) Importer Security Filing (known as “10+2”) is the compilation of various kinds of data from multiple parties involved in an import transaction into the US. The Integration Point web-based architecture and transactional processing design is ideal to address this challenge and facilitate a successful filing strategy for the US importer.**

### Integration Point 10+2 Software

The Importer Security Filing (ISF) Software combines the required product information (classification, manufacturer, etc.) and manifest information (stuffing location, consolidator, etc.) prior to lading for all goods being imported into the US. Since this data does not often reside with any one entity in the supply chain, the collection of these required data elements can be difficult for the importer. Other challenges are the security and the validity of the data collected, as well as meeting the time requirements of having all this data collected and submitted prior to lading.

Integration Point 10+2 is a Software-as-a-Service (SaaS) technology that allows companies to easily manage the collection of the data elements, compare the ISF to entries, provide the necessary security of the data, and manage the entire data workflow. The SaaS technology also provides automatic updates, keeping the user up-to-date with changing CBP data requirements.

### Import Compliance Solutions

Integration Point 10+2 is one part of a complete, web-based trade compliance solution. Integration Point Import Management also includes solutions for:

- Global Classification
- Global Trade Content
- 10+2
- Entry Visibility
- Free Trade Agreement qualification

### Benefits of Automation

Integration Point 10+2 Software assists importers with not only meeting the required ISF filing but also begins building a comprehensive, closed-loop import compliance process.

Using Integration Point 10+2 Software, importers can:

- Enable access for all trading partners and restrict access to only see applicable data
- Capture all data elements for which the importer is responsible on the ISF
- Load data from commercially available electronic files
- Identify transactions that need immediate attention such as filings with errors, filings that are open or filings that still need to be submitted
- Retrieve up-to-date bill of lading (BOL) information from within the solution
- Connect directly to CBP to file the ISF
- Set up and use data entry standards to ensure consistency across all filings, even with multiple data entry points
- Search on key fields to easily find filings with an updated status
- Adapt the solution to multiple languages based on user settings
- Centralize multiple partners in one environment so the importer can have access to all ISFs filed by the entire organization
- Retrieve a complete audit trail showing every modification made to a filing, with details about the time of change and the user making the change
- Receive email alerts when specified system events occur in tailored notification scenarios
- Improve filing accuracy by catching potential data flaws before transmitting

*All Your Trade Needs, One Integrated Solution*
